

CD Markers for Reactive vs CLL Infiltrate

CD Marker	Reactive Infiltrate	CLL Neoplastic Infiltrate
CD3	+	-
CD5	+	+
CD20	-	+
CD23	-	+
CD43	+	+

Abbreviation: CLL, chronic lymphocytic leukemia.

Data from Wilson et al.⁷

How I treat CLL...

Pankaj Malhotra
PGI, Chandigarh

30% never require treatment

Progressive cytopenias
(Disease/autoimmune)
(Anemia, thrombocytopenia)

Progressive lymphadenopathy

Indications of Treatment

Weight loss, Night sweats,
Fever

Recurrent infections, organ
dysfunction

International Workshop on Chronic Lymphocytic Leukemia (iwCLL) criteria for "active disease"

International Workshop on Chronic Lymphocytic Leukemia (iwCLL) criteria for "active disease"

The iwCLL defines "active disease" by the presence of one or more of the following criteria:

Evidence of progressive marrow failure as manifested by the development of, or worsening of, anemia and/or thrombocytopenia.*

Massive (ie, ≥ 6 cm below the left costal margin) or progressive or symptomatic splenomegaly.

Massive nodes (ie, ≥ 10 cm in longest diameter) or progressive or symptomatic lymphadenopathy.

International Workshop on Chronic Lymphocytic Leukemia (iwCLL) criteria for "active disease"

The iwCLL defines "active disease" by the presence of one or more of the following criteria:

Evidence of progressive marrow failure as manifested by the development of, or worsening of, anemia and/or thrombocytopenia.*

Massive (ie, ≥ 6 cm below the left costal margin) or progressive or symptomatic splenomegaly.

Massive nodes (ie, ≥ 10 cm in longest diameter) or progressive or symptomatic lymphadenopathy.

Progressive lymphocytosis with an increase of $>50\%$ over a 2-month period or LDT of <6 months. LDT can be obtained by linear regression extrapolation of absolute lymphocyte counts obtained at intervals of 2 weeks over an observation period of 2 to 3 months. Patients with initial blood lymphocyte counts of $<30,000/\mu\text{L}$, may require a longer observation period to determine the LDT. In addition, factors contributing to lymphocytosis or lymphadenopathy other than CLL (eg, infection) should be excluded.

International Workshop on Chronic Lymphocytic Leukemia (iwCLL) criteria for "active disease"

The iwCLL defines "active disease" by the presence of one or more of the following criteria:

Evidence of progressive marrow failure as manifested by the development of, or worsening of, anemia and/or thrombocytopenia.*

Massive (ie, ≥ 6 cm below the left costal margin) or progressive or symptomatic splenomegaly.

Massive nodes (ie, ≥ 10 cm in longest diameter) or progressive or symptomatic lymphadenopathy.

Progressive lymphocytosis with an increase of $>50\%$ over a 2-month period or LDT of <6 months. LDT can be obtained by linear regression extrapolation of absolute lymphocyte counts obtained at intervals of 2 weeks over an observation period of 2 to 3 months. Patients with initial blood lymphocyte counts of $<30,000/\text{microL}$, may require a longer observation period to determine the LDT. In addition, factors contributing to lymphocytosis or lymphadenopathy other than CLL (eg, infection) should be excluded.

Autoimmune anemia and/or thrombocytopenia that is poorly responsive to corticosteroids.

International Workshop on Chronic Lymphocytic Leukemia (iwCLL) criteria for "active disease"

The iwCLL defines "active disease" by the presence of one or more of the following criteria:

Evidence of progressive marrow failure as manifested by the development of, or worsening of, anemia and/or thrombocytopenia.*

Massive (ie, ≥ 6 cm below the left costal margin) or progressive or symptomatic splenomegaly.

Massive nodes (ie, ≥ 10 cm in longest diameter) or progressive or symptomatic lymphadenopathy.

Progressive lymphocytosis with an increase of $>50\%$ over a 2-month period or LDT of <6 months. LDT can be obtained by linear regression extrapolation of absolute lymphocyte counts obtained at intervals of 2 weeks over an observation period of 2 to 3 months. Patients with initial blood lymphocyte counts of $<30,000/\mu\text{L}$, may require a longer observation period to determine the LDT. In addition, factors contributing to lymphocytosis or lymphadenopathy other than CLL (eg, infection) should be excluded.

Autoimmune anemia and/or thrombocytopenia that is poorly responsive to corticosteroids.

Symptomatic or functional extranodal involvement (eg, skin, kidney, lung, spine).

International Workshop on Chronic Lymphocytic Leukemia (iwCLL) criteria for "active disease"

The iwCLL defines "active disease" by the presence of one or more of the following criteria:

Evidence of progressive marrow failure as manifested by the development of, or worsening of, anemia and/or thrombocytopenia.*

Massive (ie, ≥ 6 cm below the left costal margin) or progressive or symptomatic splenomegaly.

Massive nodes (ie, ≥ 10 cm in longest diameter) or progressive or symptomatic lymphadenopathy.

Progressive lymphocytosis with an increase of $>50\%$ over a 2-month period or LDT of <6 months. LDT can be obtained by linear regression extrapolation of absolute lymphocyte counts obtained at intervals of 2 weeks over an observation period of 2 to 3 months. Patients with initial blood lymphocyte counts of $<30,000/\mu\text{L}$, may require a longer observation period to determine the LDT. In addition, factors contributing to lymphocytosis or lymphadenopathy other than CLL (eg, infection) should be excluded.

Autoimmune anemia and/or thrombocytopenia that is poorly responsive to corticosteroids.

Symptomatic or functional extranodal involvement (eg, skin, kidney, lung, spine).

Constitutional symptoms, defined as any one or more of the following disease-related symptoms or signs:

- a. Unintentional weight loss of $\geq 10\%$ within the previous 6 months
- b. Significant fatigue (ie, ECOG PS ≤ 2 ; inability to work or perform usual activities)
- c. Fevers $>100.5^\circ\text{F}$ or 38.0°C for ≥ 2 weeks without other evidence of infection
- d. Night sweats for ≥ 1 month without evidence of infection

Newly Diagnosed CLL patient who does **NOT** meet the 2018 IWCLL criteria to initiate therapy

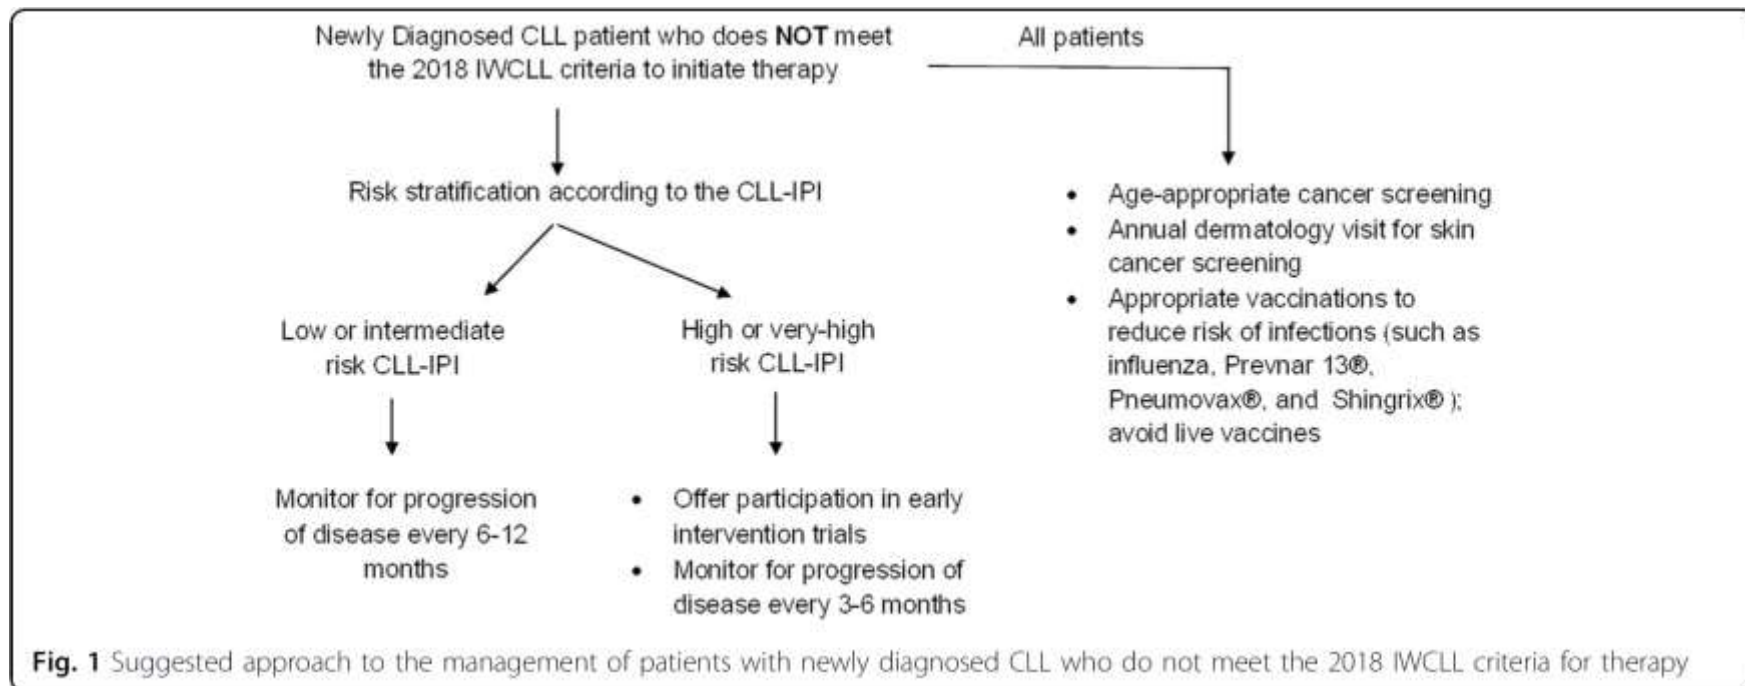

All patients

- Age-appropriate cancer screening
- Annual dermatology visit for skin cancer screening
- Appropriate vaccinations to reduce risk of infections (such as influenza, Prevnar 13®, Pneumovax®, and Shingrix®); avoid live vaccines

Thrombocytopenia grade 3/4, %	5.3	20	7.9
Infection grade 3/4, %	0	4	3.0

TABLE 6. Direct Costs for Diagnosis, Investigations, and Treatment of Chronic Lymphocytic Leukemia in India and United States

Direct Cost	India	United States²¹
Diagnosis	\$80	—
Prognosis (FISH + IgHV + β 2m)	\$150	—
Treatment		
BR regimen (6 cycles)	\$2,300	\$94,754
Chlorambucil (12 cycles)	\$120	\$9,348
Ibrutinib (1 month)	\$2,000	\$10,270

CONCLUSION Indian patients with CLL are younger in chronological age but have higher morbidity burden. Treatment outcomes with biosimilar fixed-dose BR are comparable to those reported in the literature. Chlorambucil is still a valid option, given the economic burden of the disease and treatment.

Reduced Dose Ibrutinib Due to Financial Toxicity in CLL

Deepesh P. Lad¹ · Pankaj Malhotra¹ · Alka Khadwal¹ · Gaurav Prakash¹
Arihant Jain¹ · Subhash Varma¹

2016 to April 2018. Reduced dose ibrutinib was defined as a sustained (≥ 12 months) dosing at < 420 mg/day, either at treatment initiation or within 3 months from starting therapy. Progression free survival was compared using

Reduced Dose Ibrutinib Due to Financial Toxicity in CLL

Deepesh P. Lad¹ · Pankaj Malhotra¹ · Alka Khadwal¹ · Gaurav Prakash¹
Arihant Jain¹ · Subhash Varma¹

Table 2 Comparison of patients taking a reduced dose and standard dose ibrutinib

	Reduced dose ibrutinib (n = 3)	Standard dose ibrutinib (n = 12)	<i>p</i> value
Age (years) median ± SD	60 ± 10.5	59.5 ± 10.1	NS
FISH (n)			NS
del. 17p	1	2	
del. 11q	2	3	
Others	0	7	
Median no. of prior therapies (range)	2 (1–3)	1.5 (0–4)	NS
Median follow-up (months)	12	10	NS
Adverse events (≥ grade3)	0	4/14 (28.5%)	< 0.0001
ORR	100%	91.6%	NS
Median PFS	NR	NR	NS

the two groups. The overall response rate and median PFS were also not significantly different between the two groups. In the limited patient numbers and follow-up period we show that outcomes of reduced dose ibrutinib are comparable to standard dose ibrutinib but with fewer adverse events. This study provides a proof of concept that a subset of patients might do well on reduced dose ibrutinib.

CLINICAL TRIALS AND OBSERVATIONS

A pilot study of lower doses of ibrutinib in patients with chronic lymphocytic leukemia

Lisa S. Chen,^{1,*} Prithviraj Bose,^{2,*} Nichole D. Cruz,² Yongying Jiang,³ Qi Wu,³ Philip A. Thompson,² Shuju Feng,⁴ Michael H. Kroll,⁴ Wei Qiao,⁵ Xuelin Huang,⁵ Nitin Jain,² William G. Wierda,² Michael J. Keating,² and Varsha Gandhi^{1,2}

KEY POINTS

- **A pilot trial evaluated stepwise reduction of ibrutinib dose in patients with CLL from 420 to 280 to 140 mg/d over three 28-day cycles.**
- **BTK occupancy, signaling, and biomarker data show that a lower dose of ibrutinib after 1 full dose cycle is enough for biological activity.**

The impact of dose modification and temporary interruption of ibrutinib on outcomes of chronic lymphocytic leukemia patients in routine clinical practice

Sameer A. Parikh¹  | Sara J. Achenbach² | Timothy G. Call¹ | Kari G. Rabe² | Wei Ding¹  | Jose F. Leis³ | Saad S. Kenderian¹  | Asher A. Chanan-Khan⁴ | Amber B. Koehler¹  | Susan M. SS	93.9 ± 4.3	88.7 ± 10.9	87.2 ± 8.3	88.3 ± 12	90.5 ± 12	.0006 (L)

Abbreviations: CF, cognitive functioning; EF, emotional functioning; QL, global health status; L, large, M, medium; PF, physical functioning; RF, role functioning; S, small clinical significance; SF, social functioning, SS, Summary score.

Quality of life in patients of chronic lymphocytic leukemia using the EORTC QLQ-C30 and QLQ-CLL17 questionnaire

Padma Youron¹ | Charanpreet Singh¹  | Nishant Jindal¹  | Pankaj Malhotra¹ |
Alka Khadwal¹ | Arihant Jain¹ | Gaurav Prakash¹ | Neelam Varma² |
Subhash Varma¹ | Deepesh P. Lad¹ 

Conclusions: Quality of life is severely affected in CLL patients on W&W. Global health status and worries about future health and functioning were major concerns. Socioeconomic status but not age or gender impacted QoL. Patients on ibrutinib had better QoL than on CIT.

Assessment of 285 cases of chronic lymphocytic leukemia seen at single large tertiary center in Northern India

III, <i>n</i> (%)	57 (20.1%)
IV, <i>n</i> (%)	60 (21.1%)

Table II. Comorbidities (in various different combinations) ($n = 96$).

Hypertension	50
Diabetes mellitus	47
Coronary artery disease	21
Chronic obstructive pulmonary disease	18
Hypothyroidism	10
Cirrhosis/chronic hepatitis	4

Table III. First-line chemotherapy and response.

	<i>n</i> = 141 (%)	CR (%)	PR (%)	ORR (%)	SD (%)	PD (%)
Chlorambucil-based	96 (67.85%)	3 (3.1%)	63 (65.6%)	66 (68.7%)	13 (13.4%)	17 (17.7%)
Fludarabine-based	27 (19.28%)	12 (44.44%)	12 (44.44%)	24 (88.88%)	2 (7.4%)	1 (3.7%)
CVP/CHOP	14 (10%)	1 (7.01%)	9 (64%)	10 (71%)	1 (7.1%)	3 (21.4%)

Summary & Conclusions

- Great progress in the field of CLL
- Especially in last decade
- Risk stratification (FISH and IGHV mutation)
- Asymptomatic: Wait and watch
- Symptomatic/Rai III/IV: Treatment is based on FISH and IGHV mutations
- Ibrutinib for high-risk
- BR/FCR/Chl-R₊Pred for middle-low socio
- Generic Ibrutinib has similar efficacy as innovator

Thank You
